No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                             1 HEAANGPAPLGVRAPPAWRT.....QLVRLFARGIEENPKPDSHS

Patent No. 6703491;
GENERAL INFORMATION:
APPLICANT: Homburger et al.;
TITLE OF INVENTION: Nucleic acids and proteins of;
FILE REFERENCE: File Reference: 7326-094;
CURRENT APPLICATION NUMBER: US/09/270,767;
CURRENT PILING DATE: 1999-03-17;
NUMBER OF SEQ ID NOS: 62517;
SOFTWARE: PatentIn Ver. 2.0;
SEQ ID NO 14306
                                                                                                                                                                                                                                                                                                 ĕ

Sequence 1, Application US/09970516

Patent No. 6610534

GENERAL INFORMATION:
TITLE OF INVENTION: Induction of blood vessel formation through administration of TITLE OF INVENTION: polynucleotides encoding sphingosine kinases
TITLE OF INVENTION: polynucleotides encoding sphingosine kinases
TITLE OF INVENTION: polynucleotides encoding sphingosine kinases
CURRENT APPLICATION NUMBER: US/09/970,516
CURRENT PILING DATE: 2001-10-04
NUMBER OF SEQ ID NOS: 6
SEQ ID NO 1
SEQ ID NO 1
LENGTH: 1155 1086 GGCCAGGTGCACCCCAAACTACTTCTGGATGGTCAGCGGTTGCGTGGAGCCCCCGGCCAGC 1145 276 213 309 ... Sequence 5, Application US/09970516
; Sequence 5, Application US/09970516
; Patent No. 6610534
; GENERAL INFORMATION:
    APPLICANT: No. 6610534artis AG
    APPLICANT: No. 6610534artis AG
    TITLE OF INVENTION: Induction of blood vessel formation through administration of TITLE OF INVENTION: polynucleotides encoding sphingosine kinases
    FILE REPRESENCE: 4.31617
    CURRENT APPLICATION NUMBER: US/09/970,516
    CURRENT APPLICATION NUMBER: US/09/970,516
    CURRENT FILING DATE: 2001-10-04
    NUMBER OF SEQ ID NOS: 6
    LEMENTRE: Patentin version 3.1

is the number of results predicted by chance to have a Pred. No.

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

## Claim 20; Page 134; 586pp; English.

The present line and a carrier; (2) a kit comprising, in one or more described above; (3) an isolated nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for method of identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for show; (10) a method got identifying a potential therapeutic agent for above; (10) a method of a detrivity of the polypeptide; (11) a method for modulating or pathology associated with the polypeptide; (12) method for modulating or pathology associated with the above polypeptide; NoVX ammal; and (14) a method for producing the above polypeptide; NoVX ammal; and (14) a method for producing the above polypeptide; NoVX The present invention describes NOVX proteins, where X can be 1 to 55

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. asthma), autoimmune diseases (e.g. rheumatoid arthritis) and central and peripheral nervous system disorders (e.g. parkinson's disease). The present sequence represents the human sphingosine kinase-like protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HisGluAlaAlaAsnGlyProAlaProLeuGlyValArgAlaProProAlaTrpArgThr

                                                                                                                                                                                                                                                                                               This invention relates to a novel isolated, enriched or purified nucleic acid molecule that encodes a kinase polypeptide. Specifically, it relates to buman tyrosine and serine/threonine protein kinases (FYK's and STK's), as well as protein kinase-like enzymes. The present invention describes screening methods to identify agonists, antagonists and antibodies that can be used to modulate the activity or function of the mammalian kinase enzymes. As such, these compositions can be used for gene therapy purposes to treat diseases or disorders including cancer, immune-related diseases, cardiovascular disease, brain or neuronal associated disease, metabolic and inflammatory disorders. Accordingly, they exhibit cytostatic, neuroprotective, immunomodulator and antiinflammatory activities. This polynucleotide sequence is a human kinase DNA sequence
                                                                                                                                                                                                             'nucleic acid molecule encoding a kinase polypeptide, useful forparing a composition for treating diseases or disorders, e.g., neurological, immunological or inflammatory disorders.
                                                                                                                                                                                                                                                                         Example 1; SEQ ID NO 55; 366pp; English

The present invention describes an isolated PRO nucleic acid (I). Also described: (I) a vector comprising (I); (2) a host cell comprising the vector of (I); (3) a process for producing a PRO polypeptide; (4) an isolated PRO polypeptide; (5) a chimeric molecule comprising the isolated PRO polypeptide; (5) a chimeric molecule comprising the polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4), an agonist or antagonist of the polypeptide or an antibody that binds to the polypeptide in combination with a carrier; (8) an article of manufacture comprising a container, a label on the container and a composition of matter of (7); (9) a method of treating an immune related disease in a matter of (7); (9) a method of determining the presence of a PRO polypeptide in a sample suspected of having the polypeptide; (11) a method of identifying a compound that inhibits or commanal; (12) a method of identifying a compound that inhibits or mimics the activity of or expression of a gene encoding a PRO polypeptide; and (13) a method of stimulating the immune response in a mammal. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      82
PRO sequences have antiallergic, antianaemic, antiarthritic, antidabetic, antinflammatory, antipsoriatic, antitiasthmatic, antitibroid, CNS, dermatological, gastrointestinal, haemostatic, hepatotropic, immunosotimulant, immunosupressive, muscular, nephrotropic, neuroprotective, osteopathic, respiratory, vasotropic and virucide activities, and can be used in gene therapy. The nucleic acid (I) and the encoded polypeptides, compositions, kits and methods are useful in diagnosing and treating an immune related disease and in stimulating an immune response. The present sequence represents a human PRO nucleotide sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MetGluLysProTyrAlaPheThrValHisCysValLysArgAlaArgArgHisArgTrp

sequence represents cDNA encoding a human ceramide kinase designated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        hCERKI. The invention relates to hCERKI, nucleic acids encoding it, strengthers and host cells containing hCERKI nucleic acids, the recombinant production of hCERKI and antibodies specific for hCERKI. The invention also encompasses methods of isolating hCERKI from samples, the use of hCERKI in drug screening, and the use of hCERKI nucleic acid phosphorylation of ceramides and can be used to screen for therapeutic and preventive agents for a wide range of disorders. Such disorders
 neurological disease; inflammation; human immunodeficiency virus; HIV infection; type 2 diabetes; obesity; sepsis; arteriosclerosis; cancer; neuroprotective; antilflammatory; anti-HIV; antidiabetic; anorectic; antibacterial; antiseptic; anorectic; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          infection, type 2 diabetes, obesity, sepsis, arteriosclerosis and
                                                                                                                                                                                                                                                                                                                                                                                                        Human ceramide kinase gene and the enzyme encoded by it for screening substances as drugs for neurological, inflammatory and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GCGCCGAGATGGGGGCGACGGGGGGGGGGGGGGGCGCTCTGTAATCCGTGCTGTGGGTGAAG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  23 AlaAlaGluMetGlyAlaThrGlyAlaAlaGluProLeuGlnSerValLeuTrpValLys

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX polypeptides and cativity of NOVX polypeptides associated with decreased by nucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polymeleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators.

C deponists and antagonists) of the expression and activity of NOVX. The anti-NOVX polypeptide expression and antagonists may also be used to modulate NOVX polypeptide expression and activity of NOVX colypeptides. The anti-NOVX polypeptide expression and activity of NOVX polypeptides. The anti-NOVX polypeptide antibodies and antagonists may also be used as a plead as plead to modulate NOVX polypeptide expression and activity of NOVX polypeptides.

diagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides and polynuclectides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, themaeutopoletic disorders, and the various dyslipidaemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence

This invention relates to the CDNA sequences encoding an isolated novel human polypeptide. The protein encoded by the nucleic acid of the invention is useful for treating central and peripheral nervous system diseases (e.g. peripheral neuropathy, Huntington's disease, amyotrophic alasease); neurodegenerative disease, e.g. parkinson's disease, amyotrophic clateral sclerosis, neurodegenerative disease, e.g. parkinson's disease, myotrophic crark-interplant disease (e.g. systemic lupses, rheumatoid arthritis, insulin-dependent diabetes mellitus) erythematosus, rheumatoid arthritis, insulin-dependent diabetes mellitus); wounds, ulcers, burns; bone disorders (e.g. osteoporosis, osteoarthritis); mechanical and traumatic disorders (e.g. stroke, head trauma); lung or luver fibrosis; preperfusion injury in various tissues; bacterial, viral or fungal infections; allergic conditions such as allergic rhinitis, asthma; coagulation disorders (e.g. septic shows); cancer and tumours; and inflammatory diseases (e.g. septic showth, crancer and tumours; and inflammatory diseases (e.g. septic showth, crancer or infection or function of infections agents such as bacteria, fungi, viruses, or to effect bodily characteristics, biorhythms or circadian cycles of rhythms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 195
                                                                                                                                              The present invention relates to sphingosine kinase (SphK) polypeptides and nucleic acids encoding them. SphK is useful for treating a SphK-associated disorder especially cancers such as leukaemia, lymphoma, ovarian, breast, lung, colon, testicular, stomach and skin, atherosclerosis, restenosis or ischaemia and cell proliferative disease or disorder associated with vascular diseases. SphK gene is used in gene therapy and antisense-therapy. Sphingolipids serving as signalling molecules, have recently emerged as regulators of cell growth, diferentiation, diverse cell phenotypes and cell death. Activation of SphK by tumour necrosis factor (TMF)-alpha inhibits apoptosis in human andothelial cells. The present sequence is human sphingosine kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                          9

The polynucleotide was isolated from an Hela cDNA library by PCR amplification. The invention provides polynucleotides (see AAA50808-10) and polypeptides (see AAY96057 c. 59) for the human sphingosine kinase (SK) homologues SKA, SKB and SKC. The polynucleotides may be used as hybridization probes, in the construction of PCR primers for chromosome and gene mapping, in the crecombinant production of SKA, SKB and SKC, and in the generation of associated with abnormal levels of SK expression, or to detect associated with abnormal levels of SK expression, or to detect individuals. Host cells expressing SK can be used in drug screening. Human SK specific antibodies, inhibitors, ligands or their analogues are useful as bioactive agents to treat inflammation or disease including viral, bacterial or fungal infections, allergic responses, mechanical injury associated with trauma, herefatery diseases, lymphoma or here is a conditions with activate the genes of kidney, lung, here is a conditions with activate the genes of kidney, lung,

| diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS44197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the invention and the sequence are sequences. Sequence 2241 BP; 453 A; 627 C; 700 G; 461 T; 0 U; 0 Other; | Alignment Scores:  2.03e-184 Length: 2241 Score: Sc | US-10-631-958-11 (1-562) x AAS77728 (1-2241) | 6 GlyProAlaProLeuGlyValargAlaProProAlaTrpArgThrSerPro 22<br> | 23 AlaAlaGluMetGlyAlaThrGlyAlaAlaGluBroLeuGlnSerValLeuTrpValLys 42<br> | 43 GlnGlnArgCysAlaValSerLeuGluProAlaArgAlaLeuLeuArgTrpTrpArgSer 62<br> | ProGIYProGIYAlaGIYAlaProGIYAla | 72 | 253 GACTCACCTAGCACTGGTTATTTTGCAGTATGTTCCAAGACTGGGCAGCGTTTACACCTT 312 | 72 72 | 313 CTGTTTAGCTGGTTTCTCTGGCACTGCTCCAGCAGGAACGGCGCTGGTACTGCCAGGGG 372 | 72 72 | 373 CCTGCACCCACCCTGCCCCATAGCTCAGACGTCCCCGAGGCCAGAGCTGGAGATAAA 432 | 72 72 | 433 CCCAGCTCCCAGCTGCTGACTCTGCACGCTGGCCTCTCCAGCCAG | 72 72 | 493 GGATCTCTGGTGTCCCCGGTTCACTGCCTGTTTCTTGTATCTTGTCCAGAGCTATCAGTC 552 | 72 72 | 553 ATAGCGGGACGGGAGGCTGATGCAGGTTTCCCGCGACCTGACAGCATGGAGTGGGGACGG 612 | 73 | 613 CGGGTGTTCTGTGTTGAGATGCCAGCTGAAGGACGTGGTGTTTTTACAGATGCCTGCTCT 672 | 77 ValProValSerGluIleIleAlaValGluGluThrAspValHisGlyLyBHisGlnGly 96 | 673 GTGCCTGTATCTCGAGATCGTCGTCGTTGAGGAAACAGACGTTCACGGGAAACATCATCATGGC 732 | 97 SerGlyLysTrpGlnLysMetGluLysProTyrAlaPheThrValHisCysValLysArg 116 | 733 AGTGGAAAATGGCAGAAAATGGAAAAGCCTTACGCTTTTACAGTTCACTGTAAAGAGA 792 |
